PURPOSE:To stabilize the ground color of a heat-sensitive recorder by a method wherein a heat-sensitive color developing layer, which contains a colorless or light colored dye precursor and a specified urea compound as a developer, with which color is thermally developed in the dye precursor, is provided on a support. **CONSTITUTION:**By laminating a heat-sensitive color developing layer, which contains a colorless or light colored dye precursor and a developer developing color in the dye precursor under heat, onto a support, a heat-sensitive recording body is formed. The developer is mono-urea compound represented by the formulae I and II, in which R represents a 6-10C aryl group, a 7-15C alkyl aryl group, a halogenated alkyl aryl group, an alkoxy aryl group, a 6-10C nitrated aryl group, a halogenated aryl group, a 1-4C alkyl group, a 4-8C cycloalkyl group, a 7-15C aralkyl group and an hydrogen atom, X represents a 1-6C alkyl group, a 1-4C alkoxy group, a tri-halogenated methyl group, a nitro group, a halogen atom and an hydrogen atom.
